

Additional training in bariatric, laparoscopic and robotic surgery

Program Director: Dr. Pierre Y. Garneau

Department Director: Dr. Michel Carrier

Program Secretary: Marie-Josée Beaudin

Program description

The D.E.S. in bariatric, laparoscopic and robotic surgery seeks to foster, support and promote the acquisition and development of basic, clinical, practical, technical and therapeutic knowledge, at the specialist level, in the surgical treatment of obesity. This training employs a specialized approach that fosters, supports and promotes excellence clinically and diagnostically as well as in the application of basic and clinical concepts in teaching, research and the care of obese patients.

The cornerstone of our program is education, knowledge dissemination, and collaboration with other professionals working together for patient wellbeing and for the development of skills and behaviour around obesity, rooted in profound respect for the patient.

Through the experience gained, participants will be able to conduct research, promote good practices in the field and receive continuous medical training. They will be considered specialists and references in bariatric surgery in their practice environment. They will be able to teach the various techniques they learned to residents in the program or to their peers.
